

# Online games System - Architecture.

```
while(true) {  
    check-input()  
    update-game-state()  
    render-screen()  
}
```

Note:- Tools :- unity / Unreal Engine

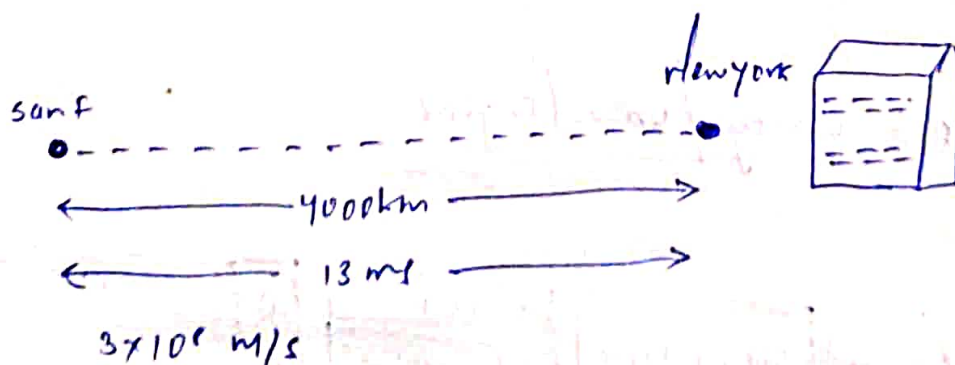

① In multiplayer game both the players should be able to see the same screen.

### Types of Games

- ① strategic games :- clark of Clans, etc
- ② slow turn games :- chess, carom ... etc.
- ③ first person games :- pubg, coo ... etc.

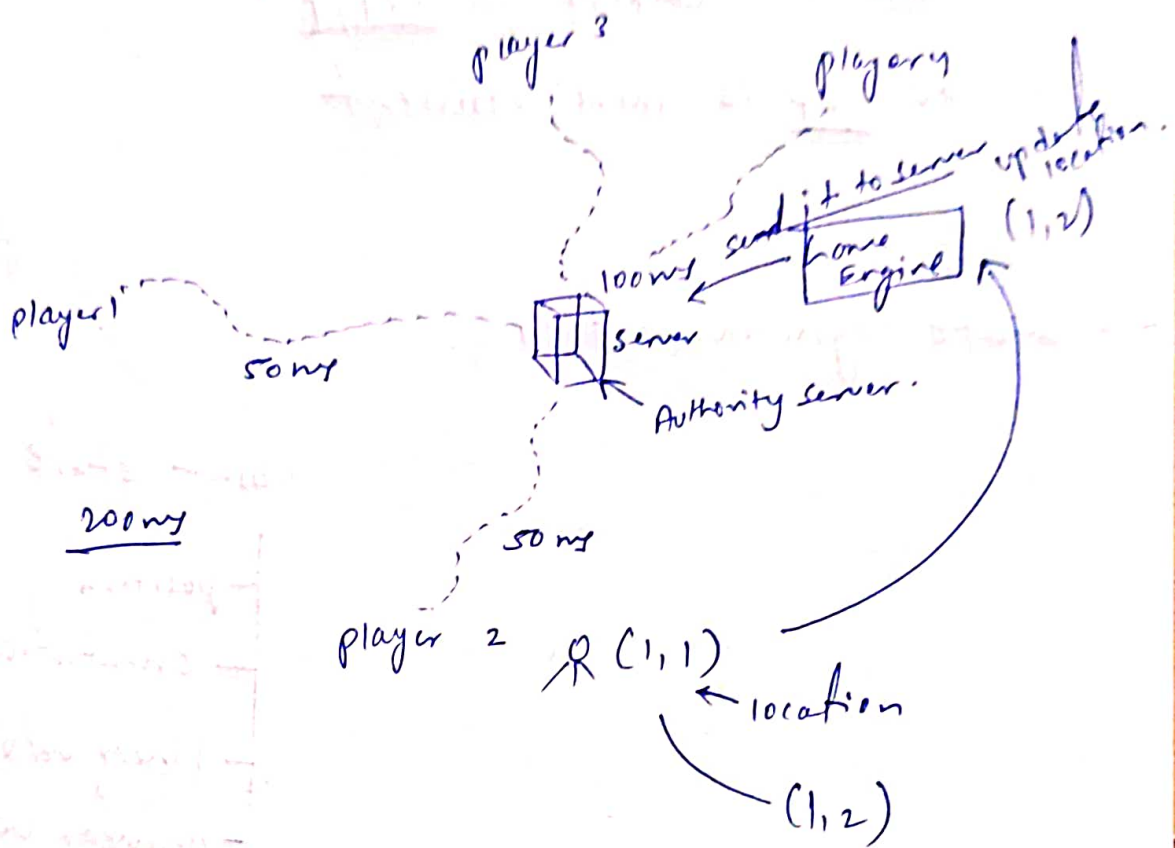

\* suppose user 1 wants to send the data user 2

Here, minimum time can be taken to send message is 13ms

less than 13ms is not possible because light speed is  $3 \times 10^8$  m/s.

- To send a message also, it should go through the OSI layers which is an protocols.

### Authority server

- ① connects all player
- ② responsible for all operations
- ③

### Game Engine

- ① Suppose one player change its location then G.E update it send it to the server and server update to all the players.

→ deterministic Lock step.

Note: If the bandwidth is not strong then we can lose packets in tcp/ip

so udp is more efficient

→ state synchronization.

object state

- position
- orientation
- linear velocity
- angular velocity.

sample code that how, objects are working.

```
function handleInput (Input - input) {
```

```
    if (input == press-B)
```

```
    {
```

```
        if (!isJumping - && !isDucking -)
```

```
        {
```

```
            // jump ....
```

```
        }
```

```
    }
```

```
    else if (input == press-down)
```

```
    {
```

```
        if (!isJumping -)
```

```
        {
```

```
            isDucking = true;
```

```
            setGraphics (Image - duck);
```

```
        }
```

```
    else
```

```
    {
```

```
        isJumping = false;
```

```
        setGraphics (Image - Dive);
```

```
    }
```

```
    else if (input == Release-down)
```

```
    {
```

```
        if (isDucking -)
```

```
        {
```

```
            // stand ---
```

```
        }
```

```
    }
```

```
}
```
